GeneralizedCM / python

Parameters:

The SSS-based masking is a special case of GCM (Generalized Code-based masking)

Linear codes for SSS-based polynomial masking

```
n=3 shares, t=1, \ell=4 bits: (3,1)-SSS (Shamir's Secret Sharing)
```

```
• Z=(X+lpha_1Y_1,X+lpha_2Y_1,X+lpha_3Y_1)=X\mathbf{G}+Y\mathbf{H} where X,Y=(Y_1) and Z are the sensitive variable, a mask and the protected variable,
                 respectively, where lpha_i for 1 \leq i \leq 3 are three public points in SSS-scheme
               • \mathbf{G} = [1, 1, 1] and \mathbf{H} = [\alpha_1, \alpha_2, \alpha_3] are two generator matrices of codes \mathcal{C} and \mathcal{D}, resp.
               • \alpha_i\in\mathbb{F}_{2^\ell}ackslash\{0\} and \alpha_1
eq lpha_2
eq lpha_3, thus there are \binom{15}{3}=455 linear codes for (3,1)-SSS
               • Each nonzero element over \mathbb{F}_{2^\ell} can be denoted as lpha^i where i\in\{0,1,\ldots,14\}, the corresponding irreducible polynomial is g(lpha)=lpha^4+lpha+1
               • Due to equivalence of linear codes, we simplify the enumeration by choosing (\alpha_1, \alpha_2, \alpha_3) = (\alpha^i, \alpha^j, \alpha^k) where i = 0 and 0 < j < k. Therefore, we get 91
                 linear codes

2.2 Optimal codes for (3,1)-SSS-based masking					
As shown in our paper, the codes satifying two conditions are optimal:					

Tab. II Linear codes for (3,1)-SSS-based masking with $d_{\mathcal{D}}^{\perp}=3$.

Weight Enumerators

[0, 1, 3, 16, 4, 39, 5, 48, 6, 48, 7, 48, 8, 39, 9, 16, 12, 1, 5, 11]

• Maximizing $d_{\mathcal{D}}^{\perp}$, here $\max\{d_{\mathcal{D}}^{\perp}\}=3$ • Minimizing $B_{d_{\mathcal{D}}^{\perp}}$, here $\min\{B_{d_{\mathcal{D}}^{\perp}}\}=16$

Note that we use two complementary metrics SNR (signal-to-noise ratio) and MI (mutual information) to assess the side-channel resistance of SSS-based masking with different codes.

As a result of Tab. II, we conclude that the optimal codes for (3,1)-SSS based masking are generated by $\mathbf{H}=[lpha_1,lpha_2,lpha_3]$ where $(\alpha_1, \alpha_2, \alpha_3) \in \{(\alpha^0, \alpha^5, \alpha^{10})\}$. Note that permutation on three public points does not change the codes due to equivalence.

```
The generator matrix of the code is:
```
